# Installing and Configuring Arctorus Exporter/Emitter Plug-in

## Installation

Installing Arctorus Exporter/Emitter Plug-in is very simple. Just copy the JAR file into **Plugins** folder of Eclipse.

Suppose your BIRT version is 2.3.2 and you want to export reports in **docx** format, you will download the following jar file.

**arctorus.birt232.docx_v1.0.0.0.jar**

Just copy it in the **Eclipse\Plugins** folder as shown in the image.

**File arctorus.birt232.docx_v1.0.0.0.jar copied in eclipse\plugins folder**

## Configuration

Once the plug-in is installed, you need to configure **Report Viewer** to show correct file extension.

**Report Viewer** has a setting file

plugins\org.eclipse.birt.report.viewer_2.3.2.r232_20090212\birt\WEB-INF\viewer.properties

**NOTE:**
Above path to settings file is for BIRT version 2.3.2. There should similar for 2.5.2 and other versions.

It's necessary to add additional options to this setting file for each file format.

For example, **DOCX** settings will be like this.

```
# [EXTENSION SETTING]
viewer.extension.docx_by_arctorus=docx

# [OUTPUT FORMAT LABEL NAME]
viewer.label.docx_by_arctorus=DOCX by arctorus
```

**Configuring Report Viewer for DOCX file format.**

Now when you will run a report in **Report Viewer**, you will see the effect of above settings as shown in the image.

**Export Format appear as DOCX by Arctorus**
